Introduction

This presentation outlines the *Car Rental System* project developed for CP317 – Software Engineering by Team 28. The project aims to address challenges in vehicle rental processes by offering an efficient digital platform for rental customers and company administrators. It covers team roles, customer needs, and project scope to provide a clear understanding of this software engineering effort.

Project Overview

Team Composition and Roles

Team 28 consists of dedicated members with defined roles to ensure project success.

Sabil Ullah Hussaini leads as Product Owner, overseeing product vision.

Moosa Ahmed serves as Scrum Master, managing agile processes.

Five developers — Mahad Farrukh, Ayesha Raheel, Kritika Kamath, Sahil Sandhu, and Shalin Panjwani — contribute to system development and implementation.

Customer Profiles and Needs

The system serves two primary customer groups: rental customers and company administrators.

Customers currently face **manual booking**, lack of real-time availability, and difficulty comparing vehicles.

Administrators struggle with inventory management and absence of a centralized rental platform.

The system aims to provide a seamless, efficient, and user-friendly rental experience for both groups.

Project Scope and Objectives

The project aims to develop a digital *Car Rental System* that streamlines the vehicle rental process. Key objectives include providing **real-time vehicle availability**, simplifying booking for customers, and empowering administrators with efficient inventory and booking management. The solution will centralize all rental activities into one platform, enhancing customer experience and optimizing business operations.

02

System Design and Functionality

System Architecture and Modules

The system architecture comprises three main components: Frontend (user interface), Backend (business logic), and Database (data storage). Core modules include User Authentication, Vehicle Search and Filtering, Booking and Payment processing, User Dashboard, and Admin Dashboard. This modular design supports scalability and maintainability.

First Time User Setup

Profile Setup

First Name	Address
Sahil	1 Real Street
Last Name	City
Sandhu	Caledon
Phone Number	Province
1112223333	Ontario
Credit Card Number (Optional)	

User and Admin Interfaces

The *User Interface* facilitates customer actions like registration, vehicle search, booking, and payment in an intuitive environment. The *Admin Interface* offers comprehensive tools for managing vehicles, bookings, and monitoring system status, ensuring operational control and oversight. Both interfaces emphasize usability and accessibility.

Workflow and Feature Highlights

The booking workflow follows a simple sequence:

Search → Select → Add to Cart → Payment →

Booking Confirmation. Key features include secure user registration, advanced vehicle filters, detailed vehicle pages, shopping cart functionality, payment simulation, booking history dashboard, and robust admin management tools.

Conclusions

The Car Rental System project successfully delivered core features, including a functional booking workflow and comprehensive dashboards for both users and administrators. Future enhancements will focus on integrating a real payment gateway, developing a mobile app, and adding advanced analytics. The project reflects strong team collaboration and aligns with course objectives.
